

Asset Pricing I: Theory and Evidence

Harry Mamaysky

October 2, 2020

1 COURSE OBJECTIVES

This course provides an overview of the field of asset pricing. The emphasis of this course is on the theoretical underpinnings of the field and the evaluation of models built to address the empirical regularities observed in the US (and to some extent international) securities data. The emphasis will largely be on discrete-time models, though we will deal with continuous-time methods in some places. The topics covered include: the law of one price and the stochastic discount factor, consumption asset pricing, recursive preferences, habit formation, measuring cash flow and discount rate news, market frictions and transaction costs, disaster risk models, empirical evidence on stock returns, and issues in fixed income and currency pricing.

This is not an econometrics course, nor an empirical asset pricing course. We will cover empirical results to the extent that they provide context for the theory. We will also work with data (a little bit) when it helps to elucidate theoretical concepts. Finally, we will do numerical analysis of some of the models we cover, which will require some programming. Numerical analysis of models is so standard in the field, that you might as well get used to these tools at an early stage.¹

The course is designed for second year doctoral students in finance. Economics doctoral students and other finance doctoral students are also welcome. Other students may take this course if they have previously taken at least one PhD-level finance course on asset pricing and one PhD-level course on statistics or econometrics.

¹I recommend either R or Python. Matlab is a good choice also, but it isn't an open source language, which is probably a disadvantage in the long-term.

2 LOGISTICS

CLASS SCHEDULE

Classes are held 5:30pm-8:45pm in Zoom, with a 15 minute break in the middle. What better way to kick off the weekend than with 3 hours spent pondering asset pricing? Table 1 shows the class dates, the anticipated class topics, and the assignment due dates.

OFFICE HOURS AND TA

My office hours are by appointment. Please email me first (hm2646@columbia.edu). My office is Uris 409. Our TA will be Cristina Tessari (CTessari21@gsb.columbia.edu). She will have office hours on TBD in TBD.

GRADING

There will be 6 homeworks (the last homework may be replaced with an in-class presentation) which will represent 40% of the grade and an in-class final which is worth 60% of the grade. Homeworks will go out roughly every two weeks. Tentative homework topics are in Table 2.

STUDENT PRESENTATIONS

We will devote most of the final three classes to students presentations of recent (or some classic) research papers that build on concepts we will have covered in class. Presentations will be done in groups of three people. Those presenting will not have to hand in homework 6, but will still be responsible for understanding the material homework 6 covers.

FINAL EXAM

We will have a three hour final during exam week. There will be a handout with many questions (and solutions) that I will give out at the end of the semester. This will be good practice for the final exam. In the past, we have been able to allow more time for the final for students who did not finish in three hours. Though the exam is intended to take less than three hours, I don't want people to get stressed because of time pressure. The final exam will be during exam week, on TBD at TBD in the virtual world.

3 MATERIALS

The course is self-contained and not based on any one book. The one that comes closest:

- * John Campbell's (fantastic) new book called *Financial Decisions and Markets* (henceforth FDM).

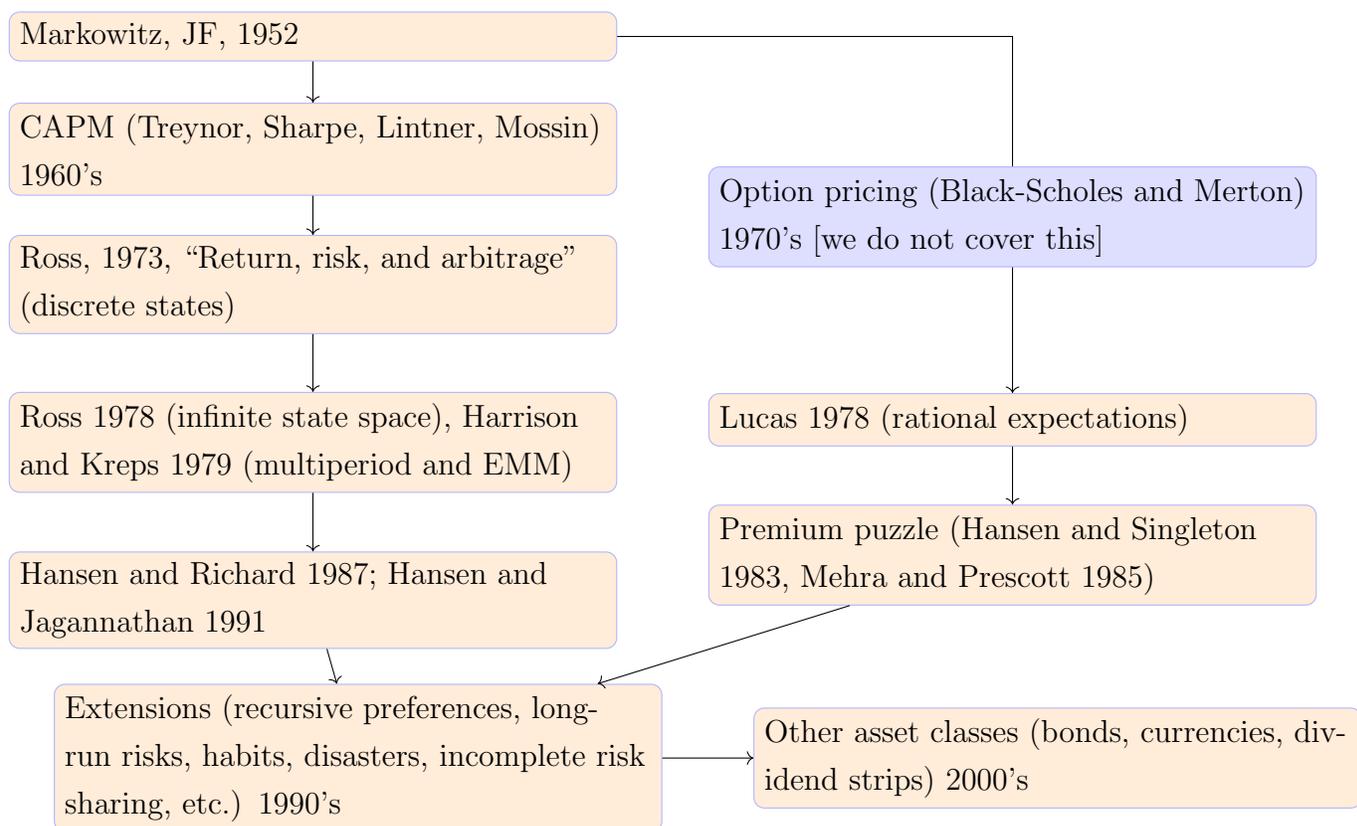

If you buy only one book for the course, buy FDM. The following books are directly relevant in parts. Cochrane's book is very close to the early part of the course flow.

- John Cochrane's book *Asset Pricing* deals with many of the theoretical underpinnings of the course – SDF's, Hansen-Jagannathan bounds, Euler equations – but spends less time on the newer extensions of the standard model, like habits, recursive preferences, and so on. If you get only two books, get this one and Campbell's.
- Ljungqvist and Sargent, *Recursive Macroeconomic Theory* for coverage of dynamic programming, as well as two excellent chapters on asset pricing.

The following books are useful references:

- Back, *Asset Pricing and Portfolio Choice Theory* as a backup reference for the Cochrane book (with slightly more technical details).
- Campbell, Lo, MacKinlay, *The Econometrics of Financial Markets* for empirical topics.
- Duffie, *Dynamic Asset Pricing* for continuous time methods.
- Harrison, *Brownian Motion and Stochastic Flow Systems* for an excellent introduction to stochastic calculus.
- LeRoy and Werner, *Principles of Financial Economics* for coverage of the CAPM and aspects of the stochastic discount factor.
- Stokey and Lucas with Prescott, *Recursive Methods in Economic Dynamics* is the classic book on dynamic programming in economics. The presentation in Ljungqvist and Sargent is much more readable, but L&S simply refer the reader here for most of the technical details.

4 LOGICAL EVOLUTION

5 TOPICS

1. Introduction

- Overview of course topics
- Arrow-Debreu state prices with finite states
- Development of Euler equation and kernel representation
- Connection to CAPM
- Empirical review

References

Breeden, D., R. Litzenberger, and T. Jia, 2015, “Consumption-based asset pricing, Part 1: Classic theory and tests, measurement issues, and limited participation,” *Annual Review of Financial Economics*, 7, 35–83.

Zhang, L., 2017, “The Investment CAPM,” *European Financial Management*, 23 (4), 545–603.

6 STUDENT PRESENTATIONS

- Students form groups and submit a ranked list of 3 papers that they would like to present. I will assign papers to groups from their lists.
- In the presentation, you should focus on the paper’s modeling contribution and any empirical tests related to this. Make sure to go over the important derivations in the paper (try not to skip steps so your classmates will understand the material). Some papers have sections dealing with continuous time models – you can skip over these (or discuss them if you feel comfortable).
- Each group will have 1 hour to present. People are strongly encouraged to ask questions during the presentations.
- The papers marked with * are recommended (for being both interesting, relevant to the class, and not too hard).

Consumption-based pricing models
